We determined the prevalence and predictors of nocturnal urinary incontinence (UI) in newly diagnosed first-ever stroke patients. From a prospective community cohort, we included the first 100 patients with ischemic stroke or transient ischemic attack (TIA), admitted to the acute stroke unit between 1 December 2006 and 30 June 2007. Data were collected at admission using a battery of questionnaires including the '3-item urinary function scale' (UFS) and the Geriatric Depression Scale (GDS). We also collected information on treatment procedures, comorbidities and prognostic indicators. The prevalence of nocturnal UI was 21% (n = 21) among the newly admitted stroke patients. Both the UFS and GDS had acceptable sensitivity (0.81 and 0.83) and specificity (0.77 and 0.76) for predicting nocturnal UI. The optimal cut-off point for UFS in predicting nocturnal UI was 2. The prevalence of nocturnal UI was significantly higher among female patients and patients with right-hemispheric stroke. Both UFS and GDS are simple tools to identify patients at risk for nocturnal UI. Nocturnal UI can be a common condition in stroke patients and needs attention.Making sense of oil, gas, and climate change. Good outcome from Alaskan Carbon Dioxide Leak It would be nice to say that the good news from the latest deep-water oil spill in the Gulf of Mexico is that the well that exploded and spewed oil for 5 days until it was capped by the BP company successfully blocked itself from dumping further oil into the sea, but I can't. There are some very troubling aspects of this story that require critical analysis. First, we need to appreciate that the well itself was so big that it had a leaking casing problem from the start. Well plugs may sound like a good idea, but they're really not, for several reasons. One, they're not always 100 percent effective, as a recent analysis of deep-water oil wells by the US Department of Energy's (DOE) National Energy Technology Laboratory (NETL) and published by the American Petroleum 82138339de
