Tanya Sharma,. Movie Reviews .This invention relates generally to methods and apparatus for joining together free ends of commutators and segments of generators and motors, and more particularly, to methods and apparatus in which such ends are ultrasonically welded. It is common practice to apply a weld between each end of a length of an armature winding of a dynamoelectric machine and the respective ends of a commutator. Ordinarily, an electric arc is maintained between the end of the winding and the end of the commutator until the ends of the winding and commutator are ultrasonically welded together. While certain techniques and methods have been utilized for ultrasonically welding together the ends of an armature winding and a commutator, substantial room for improvement has remained. For example, it is common practice to employ a wave form type oscillator to ultrasonically weld the ends of the winding and commutator together in a welding machine. The oscillator is connected to an electrode assembly which is axially reciprocated toward and away from a workpiece. Such welding machines are not completely satisfactory as the oscillator of the system tends to become unreliable and the oscillator must be replaced periodically. Also, such welding machines are not easily adapted to be used with a plurality of armature windings. Apparatus for ultrasonically welding together the ends of a length of an armature winding and a commutator has been described. In particular, U.S. Pat. Nos. 4,078,684 and 3,928,599 describe welding apparatus in which a plurality of wire end terminals are disposed axially about a ring member that is connected to a workpiece and is rotatable about the axis of the wire end terminals. Each wire end terminal is connected to an elongated bar and 595f342e71
