Currently there are two options when editing images with Photoshop: The Content Aware Scaling that is new in CS6, and the Preset Editor. The Content Aware Scaling offers pretty much the same functions as the layer scaling, but this one works better if you are still dealing with the raw files. Also very important to us are how many reviews the goods have had and what their average rating is. Obviously, you can weigh all of this by how much you trust each reviewer. Be warned that very few web services make this information available. Our goal wasn't so much to be able to read what customers think about your product as to be sure that we're not just getting biased feedback from somebody who doesn't have enough data to make an independent judgment. What really surprised me was the amount of negative reviews. There were many examples of people not happy with the performance of their purchased goods, especially where the screenshots were concerned. One of the most important features, as I mentioned above, is the ability to upload to webservices. Previous versions of the software did not make it easy to do. You were forced to manually enter all of the information - oftentimes a cumbersome and time-consuming process. Adobe has fixed this in Share for Review and they deserve appreciation for the effort they put into making a big improvement in this area. Amazon and Facebook integrations are one thing, but they are still not well-designed features. EndNote or Mendeley work much better for many reasons, not the least of which is that it saves all the information about the item in one place. They also have extensive tagging and categorization systems. The advantage of any web-based platform is that it works on any internet-connected device (phone, tablet, PC) without the need for plugins or additional software. In any case, the new update to the Amazon and Facebook options is a welcome refinement.
